Studies in North American Polygonaceae — II

JOHN KUNKEL SMALL

✓ *Eriogonum xanthum* sp. nov.

Perennial (section *Flava*), dwarf, closely pale-pubescent. Stems (caudices) closely tufted, densely leafy, the lower portions densely clothed with the persistent leaf-bases: leaves numerous, crowded; blades spatulate, 1–2.5 cm. long, obtuse, somewhat floccose and greenish above, more closely pubescent and gray beneath, rather slender-petioled: scapes 3–5 cm. tall, simple, pubescent, like the upper surface of the leaf-blades: bracts spatulate, quite similar to the leaves, but usually 1–1.5 cm. long: involucres nearly sessile, capitate, turbinate, ultimately ribbed, about 4 mm. long; lobes triangular, about one fourth as long as the tube: calyxes yellow, becoming 8 mm. long, including the stipe-like base, which is about 1.5 mm. long, silky-pubescent without; lobes spatulate or the outer ones pandurate-spatulate: filaments copiously villous below the middle: ovary sparingly pubescent at the top; styles sparingly pubescent at the base: achenes about 5.5 mm. long.

Collected on Mt. Harvard, Colorado, August 17, 1896, by C. L. Shear, no. 3789 (type), and on Gray's Peak, Colorado, August, 1873, by Mr. Woolson.

Related to both *Eriogonum flavum* and *E. aureum*, but differing from both of them in its longer slender base of the perianth and the glabrous, persistent leaf-bases.

✓ *Eriogonum umbelliferum* sp. nov.

Perennial, with woody branching rootstocks (section *Umbellata*), bright-green. Stems represented by short caudices: leaves crowded on the caudices; blades spatulate to elliptic or oval, 1–4 cm. long, or rarely longer, glabrous or nearly so at maturity, except the floccose-ciliate margins, slender-petioled: scapes 6–28 cm. tall, each topped with a 2–6-rayed umbel, which is subtended by a whorl of foliaceous bracts: peduncles mainly 1–2 cm. long and closely pubescent during anthesis, larger and thinly pubescent at maturity: involucres campanulate, sometimes becoming turbinate-campanulate, 2–2.5 mm. long, the lobes fully as long as the tube and strongly reflexed: calyxes yellow or sometimes red-tinged in age, about 8 mm. long at maturity, including the stipe-

like base, which is 2-2.5 mm. long; lobes spatulate to oblong-obovate, the inner becoming markedly longer than the outer: filaments copiously villous from above the middle to the base: ovary sparingly pubescent at the top; styles pubescent at least below the middle: achenes about 5 mm. long, the beak fully as long as the body, which is decidedly constricted at the base.

The type was collected west of Ouray, Colorado, September 9, 1901, by *L. M. Underwood*, no. 177 b. The species is apparently common in Colorado and has been collected in two other States, viz.:

WYOMING: Fort Bridger, July, 1873, *Porter*. Elk Mt., July, 1899, *Little & Stanton* 171. Fort Steele, May and June, 1901, *Tweedy* 4396. Copperton, June, 1901, *Tweedy* 4395. UTAH: Wasatch Mts., August, 1879, *Jones* 1411 and August, 1900, *Stokes*.

This species differs from its nearest relative, *Eriogonum umbellatum*, chiefly in its longer and more slender-stalked calyx and glabrous or nearly glabrous leaves.

✓ ***Eriogonum Tetraneuris* sp. nov.**

Perennial (section *Lachnogyna*), silvery-gray and silky-tomentose. Stems (caudices) tufted, very densely leafy, 1-4 cm. long, the older portions thickly clothed with old dilated leaf-bases: leaves crowded; blades elliptic to oblong, 1-3 cm. long, acute or acutish, paler and more densely pubescent beneath than above; petioles as long as the blades or shorter, ciliate and dilated below: scapes 1-1.5 dm. tall, conspicuously more densely pubescent near the top than below, simple or rarely branched, the branch subtended by a leaf-like bract: involucres sessile, capitate, subtended by lanceolate or triangular bracts, campanulate, about 3.5 mm. long, silky; lobes ovate, obtuse, about one third as long as the tube: calyxes lemon-yellow, about 6 mm. broad, silky without; lobes oblong or oblong-cuneate, the inner rather broader than the outer: filaments sparingly villous at the base: ovary densely pubescent; styles glabrous: achenes not seen.

Collected near Pueblo, Colorado, May 15, 1900, by *P. A. Rydberg & F. K. Vreeland*, no. 6324.

Related to *Eriogonum lachnogynum* but with capitate inflorescence, and in this resembling *E. villiflorum*. The involucres are slightly longer than those of *E. lachnogynum* and the calyx-lobes are not contracted below the middle. The pubescence of the

upper part of the peduncle and that of the involucres is more appressed and silky than the pubescence of *E. lachnogynum*.

✓ **Eriogonum orthocaulon** sp. nov.

Perennial with woody rootstock and caudices which are densely leafy at the ends (section *Heterosepala*). Leaves usually numerous; blades typically oval, mostly 1–1.5 cm. long, or rarely smaller, densely felty-pubescent, but usually rather more thinly so above than beneath, terminating long curved or somewhat curled petioles: scapes mainly 1–3 dm. long, simple, floccose, each terminating in a head of several involucres, which is subtended by minute or thick-subulate bracts: involucres turbinate, sometimes angled and thus turbinate-obpyramidal, about 7 mm. long, prominently ribbed, floccose, the lobes mostly broader than long and much shorter than the tube: calyxes ochroleucous, becoming 4.5–5 mm. long, the outer sepals suborbicular to ovate-orbicular, the inner linear-cuneate to pandurate, about as long as the outer: filaments slightly pubescent at the base: ovary and styles glabrous: achenes not seen.

The type was collected at Rifle, Garfield county, Colorado, June 23, 1900, by Geo. E. Osterhout, no. 2125. Specimens have been collected elsewhere as follows:

IDAHO: Foothills, June, 1892, Mulford. Blue Lakes, June 2, 1893, Palmer 62. Idaho Falls, July 4, 1901, Merrill & Wilcox 782. UTAH: Salt Lake City, May, 1869, Watson 1016. ALBERTA: Crow Nest Pass, August, 1897, Macoun 24480 and 24481.

This species is related to *Eriogonum ovalifolium* and *E. ochroleucum*, but from both of these it may be distinguished by the large involucres.

✓ **Eriogonum coloradense** sp. nov.

Perennial (section *Capitata*). Depressed stems branched at the base; branches tufted, 1–4 cm. long, clothed with the persistent leaf-bases: leaves crowded; blades narrowly spatulate to linear-spatulate, 2–5 cm. long, blunt, slightly revolute, webby-pubescent above or at length glabrous, densely white lanate-tomentose beneath, except the prominent midrib, narrowed into petiole-like bases which are dilated and scarious at the base: peduncles simple, mostly surpassed by some of the leaves, relatively stout, lanuginous, the pubescence becoming floccose: involucres in heads terminating the peduncle, campanulate, about 5 mm. long, thinly woolly without; lobes suborbicular or nearly reniform, barely one

third as long as the tube : calyxes pink or pinkish, fully 4 mm. long at maturity ; lobes blunt, the outer broadly ovate or orbicular-ovate, the inner smaller than the outer, oblong, the midrib vanishing below the apex : filaments slightly pubescent near the base : ovary and styles glabrous : achene 3-angled.

Collected on Mt. Harvard, Colorado, 1896, by *Frederic E. Clements*, no. 66.

Related to *Eriogonum pauciflorum*, but stouter and larger in all of its parts. The peduncles are mostly shorter than the leaves, which generally have flat instead of strongly revolute blades. The involucre of this species is narrower and much longer than that of *E. pauciflorum* and has the tube proportionally longer and the lobes proportionally shorter. The calyx too is at least one millimeter longer than that of *E. pauciflorum*.

✓ ***Eriogonum nudicaule* (Torr.)**

Eriogonum effusum nudicaule Torr. Pacif. R. R. Rep. 4: 132. 1857.

Related to *Eriogonum lonchophyllum* T. & G., differing in the larger calyx, the campanulate involucre and the revolute leaf-blades.

✓ ***Eriogonum scoparium* sp. nov.**

Perennial, with woody rootstocks and more or less elongated caudices (section *Corymbosa*). Leaves rather few on each caudex, but sometimes apparently numerous on prolifically branched plants ; blades linear to linear-spatulate, 2-5 cm. long, revolute, at least in age, densely lanate beneath, floccose above, relatively short-petioled, the sheathing bases of the petioles very densely woolly : scapes mainly 1-2 dm. tall, glabrous, glaucescent, each topped with a compound open cyme, the bracts very small, the lower ones often subulate-tipped : involucres broadly campanulate, 2.5-3 mm. long, and about as wide at the mouth, the lobes broad, decidedly shorter than the tube : calyxes pink or whitish, becoming 3.5-4 mm. long, the lobes oblong to obovate : filaments pubescent at the base : ovary and styles glabrous : achenes 2.5 mm. long.

The type was collected at Gunnison, Colorado, September 12, 1901, by *Underwood & Selby*, no. 376 ; other collections from Colorado are as follows : Gunnison, July 7, 1901, *Baker* 254. Denver, September, 1892, *Eastwood*.

This species may be distinguished from *Eriogonum nudicaule*

and *E. lonchophyllum* by the long-peduncled involucres in the forks of the inflorescence and from *Eriogonum salicinum* and the following species by its campanulate involucres.

✓ ***Eriogonum tristichum* sp. nov.**

Perennial with woody rootstocks and somewhat elongated caudices (section *Corymbosa*). Leaves rather few on each caudex; blades narrowly linear, oblanceolate or linear, 2–7 cm. long, usually revolute, floccose above, densely white-woolly beneath; sheathing bases of the petioles very densely white-woolly: scapes mainly 1–3 dm. tall, glabrous, except at the base, glaucescent, each topped with a compound cyme, the bracts very small except sometimes those at the first fork of the inflorescence: involucre turbinate, 2.5–3 mm. long, decidedly longer than thick, the lobes broadly rounded, much shorter than the tube: calyxes pink or whitish, becoming 4 mm. long, the lobes obovate to oblong-obovate: filaments sparingly pubescent at the base: ovary and styles glabrous: achenes about 2.5 mm. long.

The type was collected at Rosa, Colorado, June, 1899, by C. F. Baker, no. 286; other specimens have been collected in Colorado as follows: Black Cañon, Gunnison, September 1888, Parry. Mesa Verde, September, 1892, Eastwood. Arboles, June, 1899, Baker, 287. Parlin, August, 1891, Smith, 53. *Eriogonum tristichum* differs from its nearest relative, *E. salicinum*, in its larger and relatively longer involucre and the strongly revolute leaf-blades.

✓ ***Eriogonum Fendlerianum* (Benth.)**

Eriogonum microthecum Fendlerianum Benth. in DC. Prodr. 14: 18. 1856.

This species is related to both *Eriogonum corymbosum* and the following species but may be easily distinguished from either by its larger involucre.

✓ ***Eriogonum divergens* nom. nov.**

Eriogonum corymbosum divaricatum T. & G. Pacif. R. R. Rep. 2: 129. 1855. Not *E. divaricatum* Hook.

Like the preceding, this species is related to *Eriogonum corymbosum*, from which it may be distinguished by the larger more prominently lobed and scattered involucres, and the stiffly spreading branches of the inflorescence.

✓ **Eriogonum fusiforme** sp. nov.

Annual (section *Pedunculata*), glaucous. Leaves spreading; blades suborbicular, 1-5 cm. in diameter, rounded or bluntly apiculate at the apex, with scattered hairs on both surfaces, or hirsute beneath, hirsute-ciliate; petioles longer than the blades, or shorter, hirsute: scapes solitary or tufted, 2-5 dm. tall, markedly inflated below the several or many inflorescence-branches: peduncles capillary, spreading, many times longer than the involucres, abruptly bent at the base: involucres turbinate, barely 1 mm. long, the lobes ovate, shorter than the tube: calyxes white or mainly so; lobes ovate, becoming 1.5 mm. long, closely pubescent: filaments glabrous: ovary and styles glabrous: achenes about 2 mm. long, the tips exserted.

Type collected at Grand Junction, Colorado, June 20, 1893, by *De Alton Saunders*; the species is also represented by the following specimens:

COLORADO: Palisade, May 29, 1894, *Crandall*. UTAH: St. George, 1877, *Palmer* 434. Bluffs near Green River, June 15, 1901, *Stokes*. ARIZONA: Peach Springs, June 28, 1887, *Tracy & Evans* 315.

This species differs from *Eriogonum inflatum*, its nearest relative, in the much smaller turbinate and few-flowered involucres and the usually numerous large and divaricate accessory inflorescence-branches.

Polygonum buxiforme nom. nov.

Polygonum littorale Small, Mem. Dept. Bot. Columbia Coll. I : 102. (excl. synon.) 1895. Not *P. littorale* Link.

Polygonum rubescens sp. nov.

Perennial or sometimes annual, glabrous, bright-green. Stems ultimately branched at the base and above it, the branches ascending or spreading, 1-5 dm. long, striate: leaves scattered; blades thickish, narrowly oblong to elliptic or nearly linear, mainly 1-2.5 cm. long; ocreae silvery, or brown at the base, at length lacerate: flowers usually several in a cluster: calyxes becoming 3 mm. long; lobes with whitish or pinkish margins: achenes triquetrous, 2-2.5 mm. long, dull and distinctly granulate or striate.

Type collected in sandy soil at Parlin, Gunnison County, Colorado, August 16, 1901, by *B. H. Smith*, no. 55; other specimens belonging here are as follows:

COLORADO: Larimer County, June 17, 1895, *Cowen*. IDAHO:

Kootenai County, August 26, 1892, Sandberg, MacDougal & Heller 966. NEVADA: Unionville, September 1867, Watson 1055.

A species related to *Polygonum ramosissimum*, from which however it differs in the smaller whitish or pinkish margined calyx-lobes and the smaller and rougher achene.

Persicaria omissa (Greene)

Polygonum omissum Greene, Pittonia 5: 200. 1903.

This species is known from both Kansas and Colorado.

Bistorta bistortoides (Pursh)

Polygonum bistortoides Pursh, Fl. Am. Sept. 271. 1814.

Polygonum Bistorta oblongifolium Meisn in DC. Prodr. 14: 126. 1856.

This species of *Bistorta* is common in the mountains of Colorado and also in the neighboring states.

NEW YORK BOTANICAL GARDEN.

Studies in North American Polygonaceae

/

John Kunkel Small

Eriogonum xanthum sp. nov.

Perennial (section Flavd), dwarf, closely pale-pubescent. Stems
(caudices) closely tufted, densely leafy, the lower portions densely
clothed with the persistent leaf-bases : leaves numerous, crowded ;
blades spatulate, 1-2.5 cm - 1° n g> obtuse, somewhat floccose and
greenish above, more closely pubescent and gray beneath, rather
slender-petioled : scapes 3-5 cm. tall, simple, pubescent, like the
upper surface of the leaf-blades : bracts spatulate, quite similar to
the leaves, but usually 1 — 1 . 5 cm. long: involucres nearly sessile,
capitate, turbinate, ultimately ribbed, about 4 mm. long ; lobes
triangular, about one fourth as long as the tube : calyxes yellow,
becoming 8 mm. long, including the stipe-like base, which is about
1.5 mm. long, silky-pubescent without; lobes spatulate or the
outer ones pandurate-spatulate : filaments copiously villous below
the middle : ovary sparingly pubescent at the top ; styles sparingly
pubescent at the base : achenes about 5.5 mm. long.

Collected on Mt. Harvard, Colorado, August 17, 1896, by
C. L. Shear, no. jySp (type), and on Gray's Peak, Colorado,

August, 1873, by Mr. Woolson.

Related to both *Eriogonum flavum* and *E. auraim*, but differing from both of them in its longer slender base of the perianth and the glabrous, persistent leaf-bases.

* *Eriogonum umbelliferum* sp. nov.

Perennial, with woody branching rootstocks (section Umbellata) bright-green. Stems represented by short caudices : leaves crowded on the caudices ; blades spatulate to elliptic or oval, 1-4 cm. long, or rarely longer, glabrous or nearly so at maturity, except the floccose-ciliate margins, slender-petioled: scapes 6-28 cm. tall, each topped with a 2-6-rayed umbel, which is subtended by a whorl of foliaceous bracts: peduncles mainly 1-2 cm. long and closely pubescent during anthesis, larger and thinly pubescent at maturity : involucres campanulate, sometimes becoming turbinate-campanulate, 2-2.5 mm. long, the lobes fully as long as the tube and strongly reflexed : calyxes yellow or sometimes reddened in age, about 8 mm. long at maturity, including the stipe-

51

[Begin Page: Page 52]

52 Small : North American Polygonaceae

like base, which is 2-2.5 mm. long; lobes spatulate to oblong-

obovate, the inner becoming markedly longer than the outer :
filaments copiously villous from above the middle to the base :
ovary sparingly pubescent at the top ; styles pubescent at least
below the middle : achenes about 5 mm. long, the beak fully as
long as the body, which is decidedly constricted at the base.

The type was collected west of Ouray, Colorado, September 9,

1901, by L. M. Underwood, no. 177 b. The species is apparently

common in Colorado and has been collected in two other States,

viz. :

Wyoming: Fort Bridger, July, 1873, Porter. Elk Mt, July,

1899, Little & Stanton 171. Fort Steele, May and June, 1901,

Tzveedy 4396. Copperton, June, 1901, Tzveedy 4395. Utah :

Wasatch Mts., August, 1879, Jones 141 1 and August, 1900,

Stokes.

This species differs from its nearest relative, *Eriogonum umbel-*

latum, chiefly in its longer and more slender-stalked calyx and

glabrous or nearly glabrous leaves.

J Eriogonum Tetraneuris sp. nov.

Perennial (section Lachnogyna), silvery-gray and silky-tomentose. Stems (caudices) tufted, very densely leafy, 1-4 cm. long, the older portions thickly clothed with old dilated leaf-bases : leaves crowded ; blades elliptic to oblong, 1-3 cm. long, acute or acutish, paler and more densely pubescent beneath than above ; petioles as long as the blades or shorter, ciliate and dilated below : scapes 1-1.5 dm. tall, conspicuously more densely pubescent near the top than below, simple or rarely branched, the branch subtended by a leaf-like bract : involucres sessile, capitate, subtended by lanceolate or triangular bracts, campanulate, about 3.5 mm. long, silvery ; lobes ovate, obtuse, about one third as long as the tube : calyxes lemon-yellow, about 6 mm. broad, silvery without ; lobes oblong or oblong-cuneate, the inner rather broader than the outer : filaments sparingly villous at the base : ovary densely pubescent ; styles glabrous : achenes not seen.

Collected near Pueblo, Colorado, May 15, 1900, by P. A. Rydberg & F. K. Vreeland, no. 6324.

Related to *Erigonum laehnogynum* but with capitate inflorescence, and in this resembling *E. villiflorium*. The involucres are slightly longer than those of *E. laehnogynum* and the calyx-lobes are not contracted below the middle. The pubescence of the

[Begin Page: Page 53]

Small : North American Polygonaceae 53

upper part of the peduncle and that of the involucres is more appressed and silky than the pubescence of *E. lachnogynum*.

J *Eriogonum orthocaulon* sp. nov.

Perennial with woody rootstock and caudices which are densely leafy at the ends (section *Hcterosepala*). Leaves usually numerous ; blades typically oval, mostly 1-1.5 cm. long, or rarely smaller, densely felty-pubescent, but usually rather more thinly so above than beneath, terminating long curved or somewhat curled

petioles : scapes mainly 1-3 dm. long, simple, floccose, each terminating in a head of several involucres, which is subtended by minute or thick-subulate bracts : involucres turbinate, sometimes angled and thus turbinate-obpyramidal, about 7 mm. long, prominently ribbed, floccose, the lobes mostly broader than long and much shorter than the tube : calyxes ochroleucous, becoming 4.5—5 mm. long, the outer sepals suborbicular to ovate-orbicular, the inner linear-cuneate to pandurate, about as long as the outer : filaments slightly pubescent at the base : ovary and styles glabrous : achenes not seen.

The type was collected at Rifle, Garfield county, Colorado,
June 23, 1900, by Geo. E. Osterhont, no. 2125. Specimens have

been collected elsewhere as follows :

Idaho: Foothills, June, 1892, Mulford* Blue Lakes, June 2,
1893, Palmer 62. Idaho Falls, July 4, 1901, Merrill & Wilcox
782. Utah: Salt Lake City, May, 1869, Watson 10 16. Al-
berta: Crow Nest Pass, August, 1897, Maconn 24.4.80 and
24481.

This species is related to *Eriogonum ovalifolium* and *E. oc/iro-*
lencum, but from both of these it may be distinguished by the large
involucres.

^ *Eriogonum coloradense* sp. nov.

Perennial (section Capitata). Depressed stems branched at the base; branches tufted, 1-4 cm. long, clothed with the persistent leaf-bases : leaves crowded ; blades narrowly spatulate to linear-spatulate, 2-5 cm. long, blunt, slightly revolute, webby-pubescent above or at length glabrous, 1 densely white lanate-tomentose beneath, except the prominent midrib, narrowed into petiole-like bases which are dilated and scarious at the base: peduncles simple, mostly surpassed by some of the leaves, relatively stout, lanuginous, the pubescence becoming floccose : involucres in heads terminating the peduncle, campanulate, about 5 mm. long, thinly woolly without ; lobes suborbicular or nearly reniform, barely one

54 Small : North American Polygonaceae

third as long as the tube : calyxes pink or pinkish, fully 4 mm. long

m

the inner smaller than the outer, oblong, the midrib vanishing

below the apex : filaments slightly pubescent near the base : ovary
and styles glabrous : achene 3-angled.

Collected on Mt. Harvard, Colorado, 1896, by Frederic E.

Clements, no. 66.

Related to *Eriogonam pauciflornn*, but stouter and larger in all
of its parts. The peduncles are mostly shorter than the leaves,
which generally have flat instead of strongly revolute blades.

The involucre of this species is narrower and much longer than
that of *E. pauciflorm* and has the tube proportionally longer and
the lobes proportionally shorter. The calyx too is at least one

r than that of *E. pauciflorm*.

v *Eriogonum nudicaule* (Torr.)

Eriogonum effi

1857.

Jwph)

larger calyx, the campanulate involucre and the revolute leaf-

blades.

Eriogonum scoparium

Perennial, with woody rootstocks and more or less elongated caudices (section Corymbosd). Leaves rather few on each caudex, but sometimes apparently numerous on prolifically branched plants; blades linear to linear-spatulate, 2-5 cm. long, revolute, at least in age, densely lanate beneath, floccose above, relatively short-petioled, the sheathing bases of the petioles very densely woolly: scapes mainly 1-2 dm. tall, glabrous, glaucescent, each topped with a compound open cyme, the bracts very small, the lower ones often subulate-tipped : involucres broadly campanulate, 2.5-3 mm. long, and about as wide at the mouth, the lobes broad, decidedly shorter than the tube : calyxes pink or whitish, becomes 3-5-4 mm - l° n g> ^e lobes oblong to obovate: filaments pubescent at the base: ovary and styles glabrous: achenes 2.5 mm. long.

The type was collected at Gunnison, Colorado, September 12, 1901, by Underwood & Selby, no. 376 ; other collections from Colorado are as follows: Gunnison, July 7, 1901, Baker 234. Denver, September, 1892, Eastwood.

This species may be distinguished from *Eriogonum niidicaide*

[Begin Page: Page 55]

Small : North American Polygonaceae 55

and *E. lonchopJillum* by the long-peduncled involucres in the forks
of the inflorescence and from *Eriogonum salicinum* and the follow-
ing species by its campanulate involucres.

v

Eriogonum tristichum sp. no v.

Perennial with woody rootstocks and somewhat elongated
caudices (section *Corymbosd*). Leaves rather few on each caudex ;
blades narrowly linear, oblanceolate or linear, 2-7 cm. long, usually
revolute, floccose above, densely white-woolly beneath ; sheathing
bases of the petioles very densely white-woolly : scapes mainly
1-3 dm. tall, glabrous, except at the base, glaucescent, each
topped with a compound cyme, the bracts very small except some-
times those at the first fork of the inflorescence : involucre turbi-
nate, 2.5—3 mm. long, decidedly longer than thick, the lobes
broadly rounded, much shorter than the tube : calyxes pink or
whitish, becoming 4 mm. long, the lobes obovate to oblong- obovate:
filaments sparingly pubescent at the base : ovary and styles glab-
rous : achenes about 2.5 mm. long.

The type was collected at Rosa, Colorado, June, 1899, by C, F. Baker, no. 286 ; other specimens have been collected in Colorado as follows : Black Canon, Gunnison, September 1888, Parry. Mesa Verde, September, 1892, Eastwood. Arboles, June, 1899, Baker, 28 j. Parlin, August, 1891, Smith, jj. *Eriogonum tristichum* differs from its nearest relative, *E. salicinum*, in its larger and relatively longer involucre and the strongly revolute leaf-blades.

[^]*Eriogonum Fendlerianum* (Benth.)

Eriogonum microtyleicum *Fendlerianum* Benth. in DC. Prodr. 14 :

18. 1856.

This species is related to both *Eriogonum corymbosum* and the following species but may be easily distinguished from either by

its larger involucre.

v/ *Eriogonum divergens* nom. nov.

1

Eriogonum corymbosum *divaricatum* T. & G. Pacif. R. R. Rep. 2 :

129. 1855. Not *E. divaricatum* Hook.

Like the preceding, this species is related to *Eriogonum corymbosum*, from which it may be distinguished by the larger more prominently lobed and scattered involucres, and the stiffly spreading branches of the inflorescence.

[Begin Page: Page 56]

56 Small: North American Polygonaceae

i

[^]*Eriogonum fusiforme* sp. nov.

Annual (section Pedunculated), glaucous. Leaves spreading ; blades suborbicular, 1-5 cm. in diameter, rounded or bluntly apiculate at the apex, with scattered hairs on both surfaces, or hirsute beneath, hirsute-ciliate ; petioles longer than the blades, or shorter, hirsute : scapes solitary or tufted, 2-5 dm. tall, markedly inflated below the several or many inflorescence-branches : peduncles capillary, spreading, many times longer than the involucres, abruptly bent at the base : involucres turbinate, barely mm. long, the lobes ovate, shorter than the tube : calyxes white or mainly so; lobes ovate, becoming 1.5 mm. long, closely pubescent : filaments glabrous : ovary and styles glabrous : achenes about 2 mm. long, the tips exserted.

Type collected at Grand Junction, Colorado, June 20, 1893,

by De Alton Saunders ; the species is also represented by the following specimens :

Colorado : Palisade, May 29, 1894, Crandall Utah : St.

George, 1877, Palmer 4.34.. Bluffs near Green River, June 15*

1901, Stokes. Arizona: Peach Springs, June 28, 1887, Tracy &

Evans jr.

tfli

in the much smaller turbinate and few-flowered involucres and the usually numerous large and divaricate accessory inflorescence-branches.

Polygonum buxiforme nom. nov.

Polygonum Httorale SmdW, Mem. Dept. Bot. Columbia Coll. 1 : 102.
(excl. synon.) 1895. Not *P. littorale* Link.

Polygonum rubescens sp. nov.

Perennial or sometimes annual, glabrous, bright-green. Stems ultimately branched at the base and above it, the branches ascending or spreading, 1-5 dm. long, striate : leaves scattered ; blades thickish, narrowly oblong to elliptic or nearly linear, mainly i-2. 5 cm. long ; ocreae silvery, or brown at the base, at length lacerate : flowers usually several in a cluster : calyxes becoming 3 mm. long ; lobes with whitish or pinkish margins : achenes triquetrous, 2-2.5

mm. long, dull and distinctly granulate or striate.

Type collected in sandy soil at Parlin, Gunnison County, Colorado, August 16, 1901, by B. H. Smith, no. 55; other specimens belonging here are as follows :

Small : North American Polygonaceae

57

Kootenai County, August 26, 1892, Sandberg, MacDongal & Heller 966. Nevada: Unionville, September 1867, Watson 1055.
A species related to Polygo mint ramosissimum, from which however it differs in the smaller whitish or pinkish margined calyx-lobes and the smaller and rougher achene.

Persicaria omissa (Greene)

Polygonum omissum Greene, Pittonia 5 : 200.

1903.

This species is known from both Kansas and Colorado

1814.

Bistort a bistortoides (Pursh)

Polygonum bistortoides Pursh, Fl. Am. Sept. 271.

Polygonum Bistorta oblongifolium Meisn in DC. Prodr. 14: 126.

1856.

This species of *Bistorta* is common in the mountains of Colorado and also in the neighboring states.

New York Botanical Garden.
